

Review Exercise 12

Q.1 Which of the following are true and which are false?

- (i) Bisection means to divide into two equal parts (True)
- (ii) Right bisection of line segment means to draw perpendicular which passes through the midpoint of line segment (True)
- (iii) Any point on the right bisector of a line segment is not equidistant from its end points (False)
- (iv) Any point equidistant from the end points of a line segment is on the right bisector of it (True)
- (v) The right bisectors of the sides of a triangle are not concurrent (False)
- (vi) The bisectors of the angles of a triangle are concurrent (True)
- (vii) Any point on the bisector of an angle is not equidistant from its arms (False)
- (viii) Any point inside an angle equidistant from its arms, is on the bisector of it (True)

Q.2 If \overleftrightarrow{CD} is right bisector of line segment \overline{AB} , then

- (i) $m\overline{OA} = \underline{\hspace{2cm}}$ (ii) $m\overline{AQ} = \underline{\hspace{2cm}}$

Solution

- (i) $m\overline{OA} = m\overline{OB}$
 (ii) $m\overline{AQ} = m\overline{BQ}$

Q.3 Define the following

- (i) **Right Bisector of a Line Segment**

A line l is called a right bisector of a line segment if l is perpendicular to the line segment and passes through its midpoint.

- (ii) **Bisector of an Angle**

A ray BP is called the bisector of $m\angle ABC$, if P is a point in the interior of the angle and $m\angle ABP = m\angle PBC$.

Q.4 The given triangle ABC is equilateral triangle and \overline{AD} is bisector of angle A, then find, the values of unknown x° , y° and z° .

Solution

In equilateral triangle all side are equal to each and there angle of the triangle equal to 60° .

So

$$\angle B = z^\circ = 60^\circ$$

\overline{AD} is the bisector of $\angle A$

$$\angle A = 60^\circ$$

\therefore When angle A is bisected

$$x^\circ = y^\circ$$

$$x^\circ = \frac{1}{2} m\angle A$$

$$= \frac{1}{2} \times 60^\circ$$

$$x^\circ = 30^\circ$$

$$y^\circ = 30^\circ \quad (\because x^\circ = y^\circ)$$

$$\text{So } x^\circ = y^\circ = 30^\circ$$

Q.5 In the given congruent triangle LMO and LNO find the unknowns x and m given

$$\triangle LMO \cong \triangle LNO$$

$$m\overline{LM} = m\overline{LN}$$

$$2x + 6 = 18$$

$$2x = 18 - 6$$

$$2x = 12$$

$$x = \frac{12}{2}$$

$$x = 6 \text{ Unit}$$

$$m\overline{MO} = m\overline{ON}$$

$$\therefore m = 12 \text{ unit}$$

Q.6 \overline{CD} is right bisector of the line segment \overline{AB}

(i) If $m\overline{AB} = 6\text{cm}$ then find the $m\overline{AL}$ and $m\overline{LB}$

Solution

L is the midpoint of \overline{AB}

$$\therefore m\overline{AL} = m\overline{LB}$$

$$m\overline{AL} = \frac{1}{2} m\overline{AB} = \frac{1}{2} \times 6$$

$$\text{So } m\overline{AL} = 3\text{cm}$$

$$m\overline{LB} = 3\text{cm} \quad (\because m\overline{AL} = m\overline{LB})$$

(ii) If $m\overline{BD} = 4\text{cm}$ then find $m\overline{AD}$

$m\overline{AD} = m\overline{BD}$ (Any point on the right bisector of a line segment is equidistant from its end points.)

$$m\overline{AD} = 4$$

$$m\overline{AD} = 4\text{cm}$$
